No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 6, A

Sequence 57, Application US/08839765
Patent No. 6146631
GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Garcil, Stephen F.
APPLICANT: Studnika, Gary M.
TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 169
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DB 2; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ged
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cross-references: UNIPROT:098924

Experimental source: stigma extracts, var. acephala, self-compatible line P57

Experimental source: stigma extracts backbone (NCBIP:72302)

Note: sequence extracted from NCBI backbone (NCBIP:72302)

Comment: This glycoprotein, expressed only in stigmas, plays an important role in the superfamily: S-locus-specific glycoprotein, S-locus-specific glycoprotein homology
                                                                                                                                                              C; Accession: I73024

WPI; 1993-167617/20

cytotoxic Analogues of type I ribosome inactivating protein - useful as cytotoxion agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo.

Example 10; Page 115; 163pp; English.

The invention covers analogues of the plant type I RIP gelonin which have a non-naturally occurring Cys residue in a position which enables the analogue to be conjugated via a disulphide linkage to a molecule which specifically binds to a target cell. Pref. target-cell binding molecules

infections or cancer, such as prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical carcinoma, lymphoma, CMV or chondyloma acuminatum. The composition is also be used for diagnosing such diseases.

This sequence represents a peptide of the invention

ö
are antibodies or their fragments, esp. human engineered H65 antibody fragments. Fusion constructs were assembled that included a natural sequence gelonin gene fused to an H65 truncated heavy chain gene or an H65 light chain (kappa) gene. A DNA linker encoding a peptide segment of the rabbit muscile aldotase was inserted between the gelonin gene and the Ab gene. The resulting immunoconjugates can be used as cytotoxic therapeutic agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Histocompatibility Complex molecules, useful for diagnosing, preventing or treating viral infections or cancer, such as prostate cancer, hepatitis B or AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    composition of peptides and nucleic acids capable of binding Major

The invention relates to a novel composition comprising one or more peptides or nucleic acids encoding an HLA binding peptide. The composition further comprises an HTL epitope. It also comprises a spacer comprosition further comprises an HTL epitope. It also comprises a spacer molecule, a carrier, an MHC targeting sequence or a lipid. The peptides are incorporated as part of a liposome. The peptide is from an antigen selected from prostate specific antigen (PSA), prostate specific membrane selected from prostate specific antigen (PSA), prostate specific membrane antigen (PSM), hepatitis B virus (HBV) antigen, hepatitis C virus (HCV) antigen, malignant melanoma antigen (MAGB), gosteln Barr virus, Human immunodeficiency type-2 (HIV-2), antigen, malignant melanoma antigen (MAGB), posteln Barr virus, Human immunodeficiency type-2 (HIV-2), papilloma virus, Lassa virus, Mycobacterium tuberculosis (MT), p53, murine p53 (Mp53), CEA, HER2/neu, and tyrosine kinase related protein (TKP). The composition is useful for preventing or treating viral conformatum. The composition is also be used for diagnosing such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New composition of peptides and nucleic acids capable of binding Major Histocompatibility Complex molecules, useful for diagnosing, preventing or treating viral infections or cancer, such as prostate cancer,

                                                                                                                                                                                                                                                                                                                                                                                        Unidentified.
                                                                                                                            01-JUL-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-APR-2004.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sidney J,
                                                                                 ADN64270;
RESULT 3
                  ADN64270
```

The invention relates to a novel composition comprising one or more peptides or nucleic acids encoding an HLA binding peptide. The composition further comprises an HTL epitope. It also comprises a spacer molecule, a carrier, an WHC targeting sequence or a lipid. The peptides are incorporated as part of a liposome. The peptide is from an antigen are incorporated specific antigen (PBA), prostate specific membrane antigen (PBM), hepatitis B virus (HBV) antigen, hepatitis C virus (HCV) antigen, malignant melanoma antigen (MAGB), Epstein Barr virus, human immunodeficiency type-1 (HIV-1), human immunodeficiency type-2 (HIV-2), Papillona virus, Lassa virus, Mycobacterium tuberculosis (MT), p53, murine p53 (Mp53), CEA, HERZ/neu, and tyrosine kinase related protein (TKP). The composition is useful for preventing or treating viral

Also described: (1) accessing HLA (e.g. sHLA) data stored in a database; and (2) a computer system for HLA (e.g. sHLA) ligand database. The database is populated with HLA ligand sequences, motifs, extended motifs, submotifs, ligands unique to infected cells, tumour specific ligands, as well as a collection of current and future developed HLA ligand sequences. The database which contains endogenously bound and loaded ligands facilitates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human leukocyte antigen ligand database assembled by producing HLA having loaded ligands, isolating and sequencing loaded ligands to obtain HLA ligand data and populating database in computer system with ligand data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ligands likely to bind a particular HLA class I or class II protein. The database allows the user to screen an unknown peptide sequence for potential matches with SHLA ligand discrete sequences or SHLA ligand motifs of sequences. Due to the completeness and concentration of SHLA obtained to date, better sequencing data of numerous endogenously loaded HLA ligands to face to she with a ligand database, and by comparison of such ligands to each other and to the genomic sequence, better motifs are also found in the SHLA ligand database, and by comparison of such ligands to each other and to the genomic sequence, better motifs are also found in the SHLA ligand database. ABPS5692 to ABPS5912 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HLA ligand; human leukocyte antigen; predictive algorithm; database; MHC ligand; major histocompatibility complex; viral; bacterial; tumour.

The database which contains endogenously bound and loaded ligands facilitates searching of viral, bacterial, tumour or human protein sequences for ligands likely to bind a particular HLA class I or class II protein. The database allows the user to screen an unknown peptide sequence for potential matches with sHLA ligand discrete sequences or sHLA ligand motifs of sequences. Due to the completeness and concentration of sHLA obtained to date, better sequencing data of numerous endogenously loaded HLA ligands is found in the sHLA ligand database, and by comparison of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human leukocyte antigen ligand database assembled by producing HLA having loaded ligands, isolating and sequencing loaded ligands to obtain HLA ligand data and populating database in computer system with ligand data.
amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          better motifs are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a human leukocyte antigen (HLA) (e.g. solubbe HLA) ligand database assembled by a process which involves providing a computer system capable of storing HLA data as a database, producing HLA having ligands loaded on it, isolating the loaded ligands from HLA, sequencing the loaded ligands to obtain HLA ligand data, and sopulating the database with HLA ligand data. Also described: (1) accessing HLA (e.g. sHLA) data stored in a database; and (2) a computer system for HLA (e.g. sHLA) ligand database. The database is populated with HLA ligand sequences, motifs, submotifs, submotifs, ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                           HLA ligand, human leukocyte antigen; predictive algorithm; database,
MHC ligand, major histocompatibility complex; viral; bacterial; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ligands to each other and to the genomic sequence, better motifs a found in the sHLA ligand database. ligand maps from the peptide pools extracted from series of distinct yet related class I HIA-B15 allotypes; compare the different ligand maps to identify potentially shared elements; and characterise the elements identified to positively or negatively validate the occurrence of overlapping ligands. The truncated version of (WHC) can be produced in mammalian or insect/becreial cells such that milligram or greater quantities of an individual class I or class II molecule can be obtained. This sequence represents a HIA (human leukocyte antigen) peptide ligand

Sequence 7 AA;

```
The invention describes a method of producing soluble human leukocyte antigen (HLA) molecules (sHLA) in cell pharm involving amplifying HLA allelic DNA by PCR using a locus specific primer to produce truncated a cPCR product (PI), inserting P1 into mammalian expression vector; electroporating the plasmid into a host cell; inoculating the cell pharm produces sHLA. A multimeric HLA complex (I) is useful for testing functionality of peptide ligands bound by at least two soluble HLA molecules. (I) can be tested for its ability to serve as ligands for cytotoxic T lymphocytes (CTLs) and induce immune to serve as ligands for cytotoxic T lymphocytes (CTLs) and induce immune complex (I) is useful for studying T cell responses to pathological conditions such as viral infections and cancer, and for modulating the human immune system to induce tolerance in autoimmune consistence                                                                                                                                                  ö
amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Soluble human leukocyte antigen; HLA; sHLA; cell pharm; multimeric HLA complex; cytotoxic T lymphocytes; CTL; immune response; viral infection; cancer; autoimmune disease; vaccine development; MHC; major histocompatibility complex; diagnostic development; HLA class I polymorphism; HLA-B15 allotype; ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing soluble human leukocyte antigen (HLA) in cell pharm useful studies of peptide loading for characterizing human immune responses involves using HLA allelic cDNA or genomic DNA as starting material.

A multimeric HLA complex (I) is useful for testing functionality of peptide ligands by at least two soluble HLA molecules. (I) can be tested for its ability to serve as ligands for cytotoxic T lymphocytes (CTLs) and induce immune responses in humans. (I) is useful for studying T cell responses to pathological conditions such as viral infections and cancer, and for modulating the human immune system to induce tolerance in autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing soluble human leukocyte antigen (HLA) in cell pharm useful for studies of peptide loading for characterizing human immune responses involves using HLA allelic cDNA or genomic DNA as starting material.
                                                                                                                                                                                                                                                                                                                                           Soluble human leukocyte antigen; HLA; sHLA; cell pharm; multimeric HLA complex; cytotoxic T lymphocytes; CTL; immune response; viral infection; cancer; autoimmune disease; vaccine development; MHC; major histocompatibility complex; diagnostic development; HLA class I polymorphism; HLA-B15 allotype; ligand.

diseases. The individual secreted major histocompatibility complex (MHC) molecules produced are useful for studies of peptide loading (i.e., in vaccine development) and too the development of diagnostics. With the secreted MHC molecules, naturally loaded peptides can be eluted from the MHC molecule and characterised. The secreted MHC molecules allow the secreted MHC molecules allow the assessment of structural and functional impact of HHA class I was assessment of structural and functional impact of HHA class I colymorphism. The molecules are also useful to generate ligands and hence ligand maps from the peptide pools extracted from series of distinct yet related class I HHA-BIS allotypes; compare the different ligand maps to identify potentially shared elements; and characterise the elements identified to positively or negatively validate the occurrence of overlapping ligands. The truncated version of (MHC) can be produced in mammalian or insect/bacterial cells such that milligram or greater quantities of an individual class I in molecule can be obtained. This sequence represents a HLA (human leukocyte antigen) peptide ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of producing soluble human leukocyte antigen (HLA) molecules (sHLA) in cell pharm involving amplifying HLA allelic DNA by PCR using a locus specific primer to produce truncated a PCR product (PI), inserting P1 into mammalian expression vector; electroporating the plasmid into a host cell; inoculating the cell pharm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing soluble human leukocyte antigen (HLA) in cell pharm useful for studies of peptide loading for characterizing human immune responses involves using HLA allelic CDNA or genomic DNA as starting material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Soluble human leukocyte antigen; HLA; sHLA; cell pharm; multimeric HLA complex; cytotoxic T lymphocytes; CTL; immune response; viral infection; cancer; autoimmune disease; vaccine development; MHC; major histocompatibility complex; diagnostic development; HLA class I polymorphism; HLA-B15 allotype; ligand.

with the host cell such that cell pharm produces sHLA. A multimeric HLA complex (I) is useful for testing functionality of peptide ligands bound by at least two soluble HLA molecules. (I) can be tested for its ability to serve as ligands for cytotoxic T lymphocytes (CTLs) and induce immune responses in humans. (I) is useful for studying T cell responses to pathological conditions such as viral infections and cancer, and for modulating the human immune system to induce tolerance in autoimmune diseases. The individual secreted major histocompatibility complex (MHC) molecules produced are useful for studies of peptide loading (i.e., in vaccine development) and to the development of diagnostics. With the secreted MHC molecules, naturally loaded peptides can be eluted from the mile molecules and characterised. The secreted MHC molecules allow the assessment of structural and functional impact of HLA class I collymorphism. The molecules are also useful to generate ligands and hence ligand maps from the peptide pools extracted from series of distinct yet in the content of the compare the different ligand maps to related.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing soluble human leukocyte antigen (HLA) in cell pharm useful for
                                                                                                                                                                                                                                                                                                                                 identify potentially shared elements, and characterise the elements identified to positively or negatively validate the occurrence of overlapping ligands. The truncated version of (MHC) can be produced in mammalian or insect/bacterial cells such that milligram or greater quantities of an individual class I or class II molecule can be obtained This sequence represents a HLA (human leukocyte antigen) peptide ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Soluble human leukocyte antigen; HLA; sHLA; cell pharm;

Producing soluble human leukocyte antigen molecules, for testing the functionality of peptide ligands, comprises utilizing a locus-specific primer having a stop codon incorporated into a 3' primer, or that

Hildebrand WH, Prilliman KR;

WPI; 2003-863700/80.

The invention describes a method of producing soluble human leukocyte

Disclosure; Page; 148pp; English.

primer having a stop codon truncates the allelic cDNA

```
The invention describes a method of producing soluble human leukocyte antigen (HIA) molecules (sHIA) in cell pharm involving amplifying HIA allelic DNA by PCR using a locus specific primer to produce truncated a PCR product (PI), inserting Pl into mammalian expression vector; clock product (PI), inserting Pl into mammalian expression vector; electroporating the plasmid into a host cell; inoculating the cell pharm with the host cell such that cell pharm produces sHIA. A multimeric HIA complex (I) is useful for testing functionality of peptide ligands bound by at least two soluble HIA molecules. (I) can be tested for its ability to serve as ligands for cytotoxic T lymphocytes (CTLS) and induce immune responses in humans. (I) is useful for studying T cell responses to pathological conditions such as viral infections and cancer, and for cytotoxic and infections and cancer, and for molecules produced are useful for studies of peptide loading (i.e., in concerted MHC molecules, naturally loaded peptides can be eluted from the secreted MHC molecules and tuctional impact of HIA class I with the casessment of structural and functional impact of HIA class I collymorphism. The molecules are also useful to generate ligands and hence ligand maps from the peptide pools extracted from series of distinct yet casessment of an entity land to the development colligand maps to identify not entity locating the different ligand maps to identify not characterially shared alments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     soluble human leukocyte antigen; HLA; locus-specific primer; truncation; multimeric HLA complex; bioreactor; major histocompatibility complex molecule; MHC; vaccine; HLA-B15; ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        identify potentially shared elements; and characterise the elements identified to positively or negatively validate the occurrence of overlapping ligands. The truncated version of (MHC) can be produced in mammalian or insect/bacterial cells such that milligram or greater quantities of an individual class I or class II molecule can be obtained. This sequence represents a HLA (human leukocyte antigen) peptide ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
antigen (HLAM) molecules comprising utilising a locus-specific primer having a stop codon incorporated into a 3' primer, or a locus-specific primer primer that truncates the allelic cDNA resulting in a truncated PCR product having the coding regions encoding cytoplasmic and transmembrane domains of the allelic cDNA removed so that the truncated PCR product has a coding region encoding a soluble HLAA molecule. Also described is a multimeric HLAA complex comprising a substrate, and at least two soluble HLAA molecules attached to the substrate and an apparatus or a bioreactor unit for producing major histocompatibility complex molecules. The methods are useful for producing soluble human leukocyte antigen (HLA) concented. The molecules are useful for producing soluble human leukocyte antigen (HLA) concented ligands bound to the soluble HLAA molecules. The HLAA complex is useful for testing the Clunctionality of peptide ligands bound to the soluble HLAA molecules. The HLAA complex is useful for testing the molecules are also useful in vaccine development. This is the amino acid sequence of a ligand derived from a human leukocyte antigen (HLAA).

B15 family member. Note: This sequence is shown in table 4 on pages 69-70
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention describes a method of producing soluble human leukocyte antigen (HLA) molecules comprising utilising a locus-specific primer. Thay ing a stop codon incorporated into a 3' primer, or a locus-specific primer that truncates the allelic CDNA resulting in a truncated PCR product having the coding regions encoding cytoplasmic and transmembrane domains of the allelic CDNA removed so that the truncated PCR product has a coding region encoding a soluble HLA molecule. Also described is a multimeric HLA complex comprising a substrate, and at least two soluble HLA molecules attached to the substrate and an apparatus or a bioreactor unit for producing major histocompatibility complex molecules. The methods are useful for producing soluble human leukocyte antigen (HLA) molecules. The multimeric HLA complex is useful for testing the functionality of peptide ligands bound to the soluble HLA molecules are also useful in vaccine development. This is the amino acid sequence of a human leukocyte antigen (HLA)-B15 peptide found in allotypes B*1508 and B*1501.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               soluble human leukocyte antigen; HLA; locus-specific primer; truncation; untilmeric HLA complex; bioreactor; major histocompatibility complex molecule; MHC; vaccine; HLA-B15; allocype; B*1501.
                                                                    Producing soluble human leukocyte antigen molecules, for testing the functionality of peptide ligands, comprises utilizing a locus-specific primer having a stop codon incorporated into a 3' primer, or that truncates the allelic cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 38; DB 7; Length 7; Pred. The invention describes a method of producing soluble human leukocyte antigen (HLA) molecules comprising utilising a locus-specific primer having a stop codon incorporated into a 3 primer, or a locus-specific primer that truncates the allelic CDNA resulting in a truncated PCR product having the coding regions encoding cytoplasmic and transmembrane domains of the allelic CDNA removed so that the truncated PCR product has a coding region encoding a soluble HLA molecule. Also described is a multimeric HLA complex comprising a substrate, and at least two soluble HLA molecules attached to the substrate and an apparatus or a bioreactor unit for producing major histocompatibility complex molecules. The methods are useful for producing soluble human leukocyte antigen (HLA) molecules. The multimeric HLA complex is useful for testing the molecules are also useful in vaccine development. This is the amino acid sequence of a human leukocyte antigen (HLA)-B15 allocype B+1501 peptide. Note: This sequence is shown in table A on pages 88-90 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              soluble human leukocyte antigen; HLA; locus-specific primer; truncation; multimeric HLA complex; bioreactor; major histocompatibility complex molecule; MHC; vaccine; HLA-B15;
                                                                                            Producing soluble human leukocyte antigen molecules, for testing the functionality of peptide ligands, comprises utilizing a locus-specific primer having a stop codon incorporated into a 3' primer, or that truncates the allelic cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention describes a method of producing soluble human leukocyte antigen (HLA) molecules comprising utilising a locus-specific primer having a stop codon incorporated into a ' primer, or a locus-specific primer that truncates the allelic CDNA resulting in a truncated PCR product having the coding regions encoding cytoplasmic and transmembrane domains of the allelic CDNA removed so that the truncated PCR product has a coding region encoding a soluble HLA molecule. Also described is a multimeric HLA complex comprising a substrate, and at least two soluble HLA molecules attached to the substrate and an apparatus or a bioreactor unit for producing major histocompatibility complex molecules. The methods are useful for producing soluble human leukocyte antigen (HLA) molecules are useful for producing soluble human leukocyte antigen (HLA) complex is useful for testing the conclusionality of peptide ligands bound to the solubble HLA molecules are also useful in vaccine development. This is the amino acid sequence of a human leukocyte antigen (HLA)-BLS allotype B*1508 peptide. Note: This sequence is shown in table C on page 93-94 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        soluble human leukocyte antigen; HLA; locus-specific primer; truncation; multimeric HLA complex; bioreactor; major histocompatibility complex molecule; MHC; vaccine; HLA-B15; ligand.
                                                  Producing soluble human leukocyte antigen molecules, for testing the functionality of peptide ligands, comprises utilizing a locus-specific primer having a stop codon incorporated into a 3' primer, or that truncates the allelic CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               38.0%; Score 38; DB 7; Length 7; 85.7%; Pred. The invention describes a method of producing soluble human leukocyte antigen (HLA) molecules comprising utilising a locus-specific primer chaving a stop codon incorporated into a 3' primer, or a locus-specific primer that truncates the allelic CDNA resulting in a truncated PCR product having the coding regions encoding cytoplasmic and transmembrane domains of the allelic CDNA removed so that the truncated PCR product has a coding region encoding a soluble HLA molecule. Also described is a multimeric HLA complex comprising a substrate, and at least two soluble HLA molecules attached to the substrate and an apparatus or a bioreactor unit for producing major histocompatibility complex molecules. The multimeric HLA complex is useful for testing the molecules. The multimeric HLA complex is useful for testing the control of peptide ligands bound to the soluble HLA molecules. The HLA complex is useful for testing the HLA molecules are also useful in vaccine development. This is the amino acid sequence of a ligand derived from a human leukocyte antigen (HLA).

Els family member. Note: This sequence is shown in table 4 on pages 69-70
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the isolation of glutaminase (EC 3.5.1.2) from Aspergillus oryzae KBN616 and Aspergillus sojae BA-104, and the polynucleotide sequences encoding them. The invention also describes
                                      Producing soluble human leukocyte antigen molecules, for testing the functionality of peptide ligands, comprises utilizing a locus-specific primer having a stop codon incorporated into a 3' primer, or that truncates the allelic CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A new glutaminase, useful for enhancing the taste of soy and miso.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

Gaps ;

a vector containing a polynucleotide sequence encoding glutaminase, a host cell containing such a vector, and a method for the preparation of glutaminase. The glutaminase is useful for enhancing the taste of soy and miso. The present sequence represents a peptide from A. oryzae KBN616 glutaminase. (Updated on 29-AUG-2003 to standardise OS field) 88888888

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

fructose-bisphosphate aldolase (EC 4.1.2.13), non-muscle-type - Pacific lamprey
NyAlternate names: non-muscle-type aldolase
Cispecies: Lampetra tridentata, Entosphenus tridentatus (Pacific lamprey)
Cipate: 27-Sep-1995 #sequence_revision 27-Oct-1995 #text_change 20-Jun-2000
Cipacession: JC4189
Rizhang, R.; Yatuski, H.; Kusakabe, T.; Iwabe, N.; Miyata, T.; Imai, T.; Yoshida, M.; Hon

fructose-bisphosphate aldolase (EC 4.1.2.13) C - rat
N;Alternate names: aldolase C; fructose-1,6-bisphosphate triosephosphate-lyase C; fructose C; Species: Rattus norvegicus (Norway rat)
C;Baceis: Asttus norvegicus (Norway rat)
C;Bate: 30-Sep-1991 #sequence revision 30-Sep-1991 #text_change 09-Jul-2004
C;Accession: S00326; A38817; JN0127; I53313
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Residues: 1-365 <WIL>

Submitted (CTT-2001) to the EMBL/GenBank/DDBJ databases.
-!- CATALYIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone
phosphate + D-glyceraldehyde 3-phosphate.
-!- SIMILARITY: Belongs to the class I fructose-bisphosphate aldolase
                                                                                                                                    Gapa
